- ◆ Automatic systems
- ◆ Desaster prevention system: Aqua Barrier
- ◆ Fire water retention systems

Rainwater and overflowing rivers go especially through doors and windows in the basement. So here are special provisions required. A reasonable investment are Flood doors. The installation in new buildings or the retrofiting of older buildings is possible with our door.

Normally the installation does not require extensive additional action. The door is for areas which always have to be open and must be closed very fast at flooding. In conjunction with proven design and sealing technology, different frames and door leaf variants allow

the closure of spaces, wall openings or doorways.

The door is designed for positive and negative water pressure.

The RS-Team provides installation proposals for your specific installation Situation.
